Psychopharmacology in the Emergency Room

Michael D. Jibson, M.D., Ph.D.
Professor of Psychiatry
University of Michigan
1. Which of the following conditions is LEAST likely to benefit from emergency room medication?
   a. Acute anxiety
   b. Acute agitation
   c. Acute suicidality
   d. Chronic hallucinations
   e. Severe depression
Pretest

2. Which of the following is the most important goal of emergency room medication treatment?
   a. Rapid diagnosis of underlying disorder
   b. Establishment of patient and staff safety
   c. Rapid control of psychotic symptoms
   d. Reduction of suicidal ideation
   e. Disposition to appropriate follow-up care
Pretest

3. Compared to standard tablets of antipsychotics, orally disintegrating tablets have which of the following advantages?
   
   a. More rapid onset of action
   
   b. Greater bioavailability
   
   c. Significant transmucosal (eg, sublingual) absorption
   
   d. Greater ease of administration
   
   e. More appropriate dose strengths
4. Compared to haloperidol, injectable atypical antipsychotics have which of the following advantages?

a. Greater efficacy

b. Better EPS profile

c. Greater cost-effectiveness

d. More rapid onset of action

e. Greater convenience of administration
5. Benzodiazepines are identical to one another in which of the following characteristics?

a. Onset of action
b. Route of administration
c. Route of metabolism
d. Duration of action
e. Clinical efficacy
Learning Objectives

• Identify the goals and limitations of emergency room medication treatment

• Recognize the symptoms, underlying causes, and treatments of acute agitation

• Understand the advantages and disadvantages of oral and injectable administration of medications for acute agitation
Learning Objectives

- Recognized the advantages and disadvantages of the different antipsychotics for acute agitation
- List the characteristics of lorazepam for treatment of acute agitation or acute anxiety
- Identify the symptoms of and treatments for acute dystonia
Outline

• Appropriate targets for emergency room medication

• Acute agitation
  • Clinical description
  • Underlying causes
  • Goals of treatment
  • Medications
    • PO antipsychotics
    • IM antipsychotics
    • Benzodiazepines
  • Treatment selection
Outline

• Acute anxiety
  • Diagnosis
  • Treatment

• Acute dystonic reactions
  • Diagnosis
  • Risk factors
  • Treatment
Treatment Principles

• Patient and staff safety are the highest priorities
• Pharmacologic interventions in the emergency room are limited to specific situations and target symptoms
• Treatment selection is based on:
  • target symptoms
  • underlying pathology
  • preferred route of administration
Emergency Pharmacology

Likely to benefit from emergency medications

• Psychotic agitation
• Acute anxiety
• Alcohol/sedative/hypnotic withdrawal
• Acute dystonic reaction
Emergency Pharmacology

Unlikely to benefit from emergency medications

- Major depression
- Suicidality
- Other drug withdrawal
Evaluation and Treatment of Acute Agitation
Agitation

Acute state of

• Anxiety
• Heightened arousal
• Increased motor activity
Agitation

May include

- Lack of cooperation
- Attempts to elope
- Hostility
- Aggression
Agitation

May be caused by

- Drug or alcohol intoxication
- Alcohol or sedative withdrawal
- Personality disorders
- Mood disorders
- Psychotic disorders
- Delirium
- Hypoxia
- Cognitive impairment
Agitation

May occur in conjunction with psychosis

- Mania
- Disturbing content of delusions or hallucinations
- Thought disorganization
- Intrusion of law enforcement or mental health workers
- Akathisia
Agitation

May include aggression related to

- More severe pathology
- Persecutory delusions
- Thought disorganization
- Command hallucinations
Treatment

Goals

- Maintain patient and staff safety
- Identify and address underlying pathology
  - Reduce psychosis
  - Reduce mania
  - Improve cognition
  - Treat medical problems
Treatment

Essential Resources

• Adequate staff
• Verbal de-escalation
• Medication
• Room seclusion
• Physical restraints
Treatment

Medications

• Antipsychotics
  • Oral
  • Injectable

• Benzodiazepines
  • Oral
  • Injectable
Oral Antipsychotics

Preferred Option

• Orally disintegrating tablets

Alternative Options

• Standard tablets
• Liquid concentrate
• Sublingual tablets
<table>
<thead>
<tr>
<th>Oral Antipsychotics</th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>• Standard tablets</td>
<td>- Most antipsychotics are available</td>
</tr>
<tr>
<td></td>
<td>- Easy to cheek</td>
</tr>
<tr>
<td>• Liquid concentrate</td>
<td>- Many antipsychotics are available</td>
</tr>
<tr>
<td></td>
<td>- Difficult to administer</td>
</tr>
<tr>
<td>• Sublingual tablets</td>
<td>- Only asenapine (Saphris) is available</td>
</tr>
<tr>
<td></td>
<td>- No data on use for acute agitation</td>
</tr>
</tbody>
</table>
Oral Antipsychotics

Orally Disintegrating Tablets

- Easy to administer
- Noninvasive
- Hard to "cheek"
- **NOT** absorbed transmucosally
- Same pharmacokinetics as standard tablets
Oral Antipsychotics

Orally Disintegrating Tablets

- Aripiprazole (Abilify Discmelt)
- Olanzapine (Zyprexa Zydis)
- Risperidone (Risperdal M-Tab)
Aripiprazole

Dosing (disintegrating tablets)

- 10-15 mg q 2 hrs
- Average dose: 20 mg/day
- Maximum recommended dose: 30 mg/day
- Supplied in 10 mg and 15 mg tablets
Aripiprazole

Pharmacokinetics (oral)

- 3-5 hr to peak concentration
- 75-hr elimination half-time
- No significant drug interactions
- Pharmacokinetics are identical to standard tablet
Aripiprazole

Short-term Side Effects

• Nausea/vomiting
• Akathisia
• Insomnia
Aripiprazole

Treatment Issues

• Nonsedating

• The combination of a partial agonist with an antagonist (ie, all other antipsychotics) leads to unpredictable receptor activities
Risperidone

Dosing (disintegrating tablets)

• 1-2 mg q 30 min - 2 hrs
• Average dose: 4 mg/day
• Maximum recommended dose: 6 mg/day
• Supplied in 0.5 mg, 1 mg, 2 mg, 3 mg, and 4 mg tablets
Risperidone

Pharmacokinetics (oral)

• 1.5-hr to peak concentration
• 20-hr elimination half-time
• No significant drug interactions
• Pharmacokinetics are identical to standard tablets
Risperidone

Short-term Side Effects

• Sedation
• Orthostatic hypotension
• Akathisia
• EPS (dose-dependent)
Risperidone

Treatment Issues

- Higher risk of EPS
- Intermediate level of sedation
Olanzapine

Dosing (disintegrating tablets)

- 5-10 mg q 30 min - 2 hrs
- Average dose: 10 mg/day
- Maximum recommended dose: 20 mg/day
- Supplied as 5 mg, 10 mg, 15 mg, and 20 mg tablets
Olanzapine

Pharmacokinetics (oral)

- 5-hr to peak concentration
- 30-hr elimination half-time
- No major drug-drug interactions
- Pharmacokinetics are identical to coated tablets
Olanzapine

Treatment Issues

- More sedating
- More anticholinergic
Injectable Antipsychotics

Intramuscular Injection

- Ensured administration
- Rapid absorption
- Difficult to administer
- Invasive
Injectable Antipsychotic Medications

- Haloperidol (Haldol)
- Aripiprazole (Abilify)
- Olanzapine (Zyprexa)
- Ziprasidone (Geodon)
Haloperidol

Dosing (intramuscular or intravenous injection)

• 5-10 mg q 30 min - q 2 hr
• Average dose: 10 mg/day
• Maximum recommended dose: 20 mg/day
Haloperidol

Pharmacokinetics (IM or IV injection)

- IV: 20-30 min to peak concentration
- IM: 30-45 min to peak concentration
- 20-hr elimination half-time
- No major drug-drug interactions
Haloperidol

Short-term Side Effects

• Akathisia
• Acute dystonia
• Extrapyramidal side effects (EPS)
• Sedation
Haloperidol

Treatment Issues

- Multiple routes of administration
- Low cost
- High risk of side effects
- May require treatment transition
Aripiprazole

Dosing (intramuscular injection)

- 9.75 mg q 2 hrs
- Average dose: 19.5 mg/day
- Maximum recommended dose: 30 mg/day
- Available in 9.75 mg vials
Aripiprazole

Pharmacokinetics (injectable)

• 1-3 hr to peak concentration
• 75-hr elimination half-time
• No major drug-drug interactions
Aripiprazole

Short-term Side Effects

- Nausea/vomiting
- Headache
- Mild sedation
Aripiprazole

Treatment Issues

• Less sedation
• May be administered concurrently with BZDs
• Partial agonist-antagonist combinations lead to unpredictable receptor activities
Olanzapine

Dosing (intramuscular injection)

• 10 mg q 30 min - 2 hrs
• Average dose: 20 mg/day
• Maximum recommended dose: 30 mg/day
Olanzapine

Pharmacokinetics (injectable)

- 15-45 min to peak concentration
- 30-hr elimination half-time
- No major drug-drug interactions
Olanzapine

Short-term Side Effects

• Sedation
• Orthostatic hypotension
• Anticholinergic effects
• Akathisia
Olanzapine

Treatment Issues

• More sedating

• Unclear if safe with BZDs
  • No controlled studies of safety
  • No published case reports of problems
  • Some expert guidelines recommend a 1-hr delay between the medications to avoid cardiorespiratory depression
Ziprasidone

Dosing (intramuscular injection)

- Common dose range: 10-40 mg/day q 4 hr
- Average dose: 20 mg/injection
- Maximum recommended dose: 40 mg/day
- Available in 20 mg vials
Ziprasidone

Pharmacokinetics (injectable)

• 1 hr to peak concentration
• 2.5-hr elimination half-time
• Serum levels decreased by carbamazepine
Ziprasidone

Short-term Side Effects

• Somnolence
• Nausea
• Akathisia
• qTc prolongation
Ziprasidone

Treatment Issues

- Moderately sedating
- No cardiac problems have been reported
  but
- Avoid use with other agents causing qTc prolongation
### Benzodiazepines

<table>
<thead>
<tr>
<th>Alprazolam (Xanax)</th>
<th>Lorazepam (Ativan)</th>

<td></td>
</tr>
</tbody>
</table>
Benzodiazepines

Differ in

• Potency
• Onset of action
• Duration of action
• Route of administration
• Metabolic pathways

Are identical in

• Efficacy
• Clinical activity
• Pharmacologic activity
Benzodiazepines

**Intramuscular**

- Lorazepam (Ativan)

**Intravenous**

- Chlordiazepoxide (Librium)
- Diazepam (Dizac, Valium)
- Lorazepam (Ativan)
Lorazepam

Dosing (oral, intramuscular, intravenous)

• 1-2 mg q 30 min - 2 hr
• Average dose: 2-4 mg/day
• Maximum recommended dose: 12 mg/day
Lorazepam

Pharmacokinetics (Oral)

• 30 min to onset of action
• 2 hr to peak concentration
• 16 hr serum half-time
• No active metabolites
• Metabolism not affected by liver dysfunction
Lorazepam

Pharmacokinetics (IM or IV injection)

- 30 min to peak concentration
- 16 hr serum half-time
Lorazepam

Side Effects

- Sedation
- Disinhibition
- Delirium
- Respiratory depression
Lorazepam

Treatment Issues

• Highly sedating
• Generally well tolerated
• May cause respiratory depression when given IV
• May cause delirium or disinhibition
Treatment Selection for Psychotic Agitation

• FDA studies do not include highly agitated, involuntary patients
• Few studies compare available drugs
• Published studies are small, uncontrolled, and retrospective
Treatment Selection for Psychotic Agitation

Antipsychotics

- All antipsychotics appear comparable in efficacy
- Differences in onset of action have not been demonstrated
- Side effect profiles differ, but are rarely important in the acute phase
- Mode of administration differs
Treatment Selection for Psychotic Agitation

Benzodiazepines

- In the short term, benzodiazepines appear at least as effective as antipsychotics
- Benzodiazepines are highly sedating
- Lorazepam is the only IM benzodiazepine
Treatment Selection for Psychotic Agitation

- Antipsychotics are essential to treat underlying psychosis or mania
- Antipsychotics may have longer duration of action
- The combination of antipsychotics and benzodiazepines appears more effective than either one alone (but only one major study)
Evaluation and Treatment of Acute Anxiety
Acute Anxiety

Differential Diagnosis

- Panic attack
- Generalized anxiety
- Adjustment disorder
- Posttraumatic stress disorder (PTSD)
- Medical conditions
- Drug intoxication or withdrawal
Acute Anxiety

Treatment

• Benzodiazepines provide optimal short-term treatment for anxiety and panic symptoms

• Benzodiazepines may be used as an interim treatment during titration of other medications for anxiety (e.g., SSRIs, SNRIs).
Acute Dystonic Reaction
Acute Dystonic Reaction

- Intense muscle cramps as side effect of antipsychotic medications
- Highest risk with high potency first generation antipsychotics (e.g., haloperidol, thiothixene, fluphenazine)
- Not specific to any one medication
Acute Dystonic Reaction

- Most common early in treatment or shortly after a dose increase
- Highest incidence is at trough drug level
- May be isolated to specific regions of the body
  - Oculogyric crisis (extraocular muscles)
  - Torticollis (neck)
  - Laryngospasm (throat/larynx) – may be life threatening
Acute Dystonic Reaction

Treatment

- **Benztropine (Cogentin)**
  - 2 mg IM q 15-30 min up to 8 mg/day
- **Diphenhydramine (Benadryl)**
  - 50 mg IM q 15-30 min up to 200 mg/day
Post-test

1. Which of the following conditions is LEAST likely to benefit from emergency room medication?
   a. Acute anxiety
   b. Acute agitation
   c. Acute suicidality
   d. Chronic hallucinations
   e. Severe depression
2. Which of the following is the most important goal of emergency room medication treatment?

   a. Rapid diagnosis of underlying disorder
   b. Establishment of patient and staff safety
   c. Rapid control of psychotic symptoms
   d. Reduction of suicidal ideation
   e. Disposition to appropriate follow-up care
3. Compared to standard tablets of antipsychotics, orally disintegrating tablets have which of the following advantages?

a. More rapid onset of action
b. Greater bioavailability
c. Significant transmucosal (eg, sublingual) absorption
d. Greater ease of administration
e. More appropriate dose strengths
Post-test

4. Compared to haloperidol, injectable atypical antipsychotics have which of the following advantages?
   a. Greater efficacy
   b. Better EPS profile
   c. Greater cost-effectiveness
   d. More rapid onset of action
   e. Greater convenience of administration
5. Benzodiazepines are identical to one another in which of the following characteristics?

a. Onset of action
b. Route of administration
c. Route of metabolism
d. Duration of action
e. Clinical efficacy
Pre- and Post-test Answers

1. c
2. b
3. d
4. b
5. e
